PROJECT PROPOSAL

Project Title	BorrowBox
Student Name	Aliha Mamoon
Registration No.	2025-APC-28
Course	Software Engineering
Instructor	Sir Moaz

BorrowBox: Project Overview

1. Problem Statement

People frequently need certain items for a short period, such as calculators, books, tripods, power banks, presentation equipment, or formal clothes.

Purchasing these items for temporary use can be costly, while finding someone willing to lend them is often difficult. BorrowBox addresses this gap by providing an organized way to connect people who need items with people who are willing to share them.

2. Proposed Solution

BorrowBox is proposed as a web-based item borrowing and sharing platform.

Users will be able to list items they are willing to lend, search for items they need, and submit borrowing requests. Item owners can review requests and accept or reject them. The platform will also support basic tracking of borrowing periods and expected return dates.

3. Objectives

The main objective of BorrowBox is to make temporary item sharing easier, more affordable, and more organized. The project aims to help users access needed items without purchasing them, provide owners with control over borrowing requests, and maintain clear records of borrowed items and their return information.
